Introduction

✓
Ad-670151
This report is a supplement to ~~APL/JHU report TG-451~~,
entitled 'Marcum's and Swerling's Data on Target Detection by
a Pulsed Radar.' In ~~TG-451~~, graphed data are presented which
were obtained by high speed digital calculations based on the
statistical analyses of Marcum and Swerling. Although these
graphs are sufficient for many applications of the computed
data, there are some applications which require a better
definition of the data so that the limited resolution of the
graphs can be avoided. For example, in documenting the per-
formance of a proposed radar, it would be advantageous to
specify that such documentation be standardized and based on
tabulated data rather than on graphed data. Graphs introduce
the variabilities of both the plotter and the reader.

✓
To accommodate those who have need for precise analytic
data on radar target detection, the data which were plotted
in ~~TG-451~~ are presented here in tabulated form; and in addi-
tion, data are presented for 6000 pulses integrated inco-
herently. Data could be computed for still large numbers of
integrated pulses but not without a significant modification
of the original computational program and a careful considera-
tion of the storage capacity of the computing machine. At the
present time, the need for data above 3000 integrations is not
great; however, the availability of data for 6000 permits
better interpolation for intermediate values. For additional
details refer to TG 451.

The labels used for parameters and column headings in the tables below are largely self-explanatory. However, to avoid ambiguous interpretation, the following definitions are given.

<u>Label</u>	<u>Discussion</u>	<u>Marcum's and/or Swerling's Symbol</u>
PULSES INTEGRATED INCOHERENTLY	The integration of pulses of reradiated electromagnetic energy with random relative phase.	N
FALSE ALARM NUMBER	The number of opportunities for a false alarm in the false alarm time.	n'
BIAS ON ROOT MEAN SQUARE NOISE	The factor by which root mean square noise is multiplied to obtain a threshold value of signal voltage level.	Y_b
SIGNAL TO NOISE RATIO	The signal to noise power ratio at the input to the radar receiver.	x (Marcum) x, \bar{x} (Swerling)
SIGNAL TO NOISE RATIO DB	The ratio in decibels rounded to integers. The calculation was actually performed for the values tabulated for SIGNAL TO NOISE RATIO	-
NORMALIZED RANGE	The ratio of the actual range to a target to the range for which the signal to noise ratio is 1.	R \bar{R}_0
DET. PROB.	The probability that the voltage level of incoherently integrated pulses exceeds the threshold. False alarms are not distinguishable from reports of real targets. From the computational point of view, the tabulated values are correct to at least 6 decimal places.	P_N (Marcum) P_D (Swerling)

NON- FLUCTUATING TARGET	A target of constant radar cross section as observed at the radar.	σ corresponding to x
FLUCTUATING TARGET	A target which varies in radar cross section as observed at the radar.	σ corresponding to \bar{x}
CASE 1	Scan to scan fluctuations according to the probabil- ity density function	-
	$w(x, \bar{x}) = \frac{1}{\bar{x}} \exp\left(-\frac{x}{\bar{x}}\right); x = 0.$	
CASE 2	Same as CASE 1 except pulse to pulse fluctuations in- stead of scan to scan.	-
CASE 3	Scan to scan fluctuations according to the probability density function	-
	$w(x, \bar{x}) = \frac{4x}{\bar{x}^2} \exp\left(-\frac{2x}{\bar{x}}\right); x = 0.$	
CASE 4	Same as CASE 3 except pulse to pulse fluctuations instead of scan to scan.	-
